Dr. Riccardo Ferrante is a Researcher at the Italian National Institute for Insurance against Accidents at Work (INAIL), Research Department, Department of Occupational and Environmental Medicine, Epidemiology and Hygiene.

His research activities focus on environmental and workplace monitoring and the assessment of occupational exposure to emerging contaminants, with particular expertise in the chemical-physical characterization of airborne nanomaterials and the identification and quantification of chemical contaminants in environmental matrices.

His research experience includes the analysis of metals using spectroscopic techniques, as well as the assessment of occupational exposure to anticancer chemotherapeutic drugs. He has also worked on the identification and quantification of persistent organic pollutants (POPs), including PCDD/PCDF and PCBs, and volatile and semi-volatile organic compounds (VOCs and SVOCs) in environmental matrices.

He holds a PhD in Environmental and Industrial Hygiene and a Master's Degree in Chemistry, specializing in Analytical Chemistry. He is also qualified to practice as a professional chemist.
