Vincenzo M. Mastronardi earned a PhD in Materials Science and Technology in 2016 at the Center for Biomolecular Nanotechnologies of the Istituto Italiano di Tecnologia (IIT), through the Scuola Interpolitecnica di Dottorato in Turin, Italy.

From 2016 to 2021, he was a postdoctoral researcher at IIT, where he developed implantable and wearable sensors based on aluminum nitride. His work focused on monitoring cardiac and swallowing activity, supporting the early detection of dysphagia, and developing smart patches for tracking vital and physiological parameters.

Since 2022, he has been a researcher at the Department of Innovation Engineering of the University of Salento in Lecce, Italy. His current research focuses on the design and testing of wearable piezoresistive, piezoelectric, and inertial sensors for monitoring physiological parameters and joint movements. His broader interests include flexible and silicon-based MEMS, pressure and force sensors, and piezoelectric energy-harvesting devices
