Dr. Francesca Tombolini is a Researcher at the Italian National Institute for Insurance against Accidents at Work (INAIL), Department of Research, Certification and Verification (DiMEILA), Hazardous Substances Risk Laboratory.

His research activities focus on the assessment of occupational exposure to airborne nanomaterials, using standardized environmental monitoring methodologies, and on their morphological and spectroscopic characterization by electron microscopy and spectroscopic techniques.

Since 2009, his research has included the **evaluation of respiratory protective equipment under both simulated laboratory conditions and real workplace scenarios, as well as the synthesis and characterization of carbon nanotubes using SEM, TEM, EELS and Raman spectroscopy.

He received a PhD in Physics from Roma Tre University in 2006, with a thesis on Carbon Nanotubes: from synthesis to characterization, and a Master's degree in Physics from Sapienza University of Rome in 2002, with a thesis on the application of polarized XANES spectroscopy to layered ordered systems.

He is author of more than 45 peer-reviewed scientific publications.
